Abstract

Netsukuku is a P2P network system designed to handle a large number of nodes with minimal CPU and memory resources. It can be easily used to build a worldwide distributed, anonymous and not controlled network, separated from the Internet, without the support of any servers, ISPs or authority controls.

In this document, we give a generic and non technical description of the Netsukuku network, emphasizing its main ideas and features.

1 The old wired

The Internet is a hierarchic network managed by multinational companies and organisations supported by q
The Internet Service Providers give the connectivity to all the users, who are in the lowest rank of this hierar

In China, the whole net is constantly watched by several computers filtering
